

## IPM – Automation Tailored to Your Needs

Small-series production – your goal, our expertise.

Do you want to engage in small-series production? Are you looking to optimize your manufacturing process? How to properly clamp a part? What technology to choose? With the help of IPM, we are ready to meet your requirements. It is a combination of a suitable engineering solution and the implementation of our production management software. Thanks to this integration, we can increase the productivity of your production, optimize machine utilization, and save valuable resources. We have more than 20 years of experience in this field and satisfied customers across Europe.

## Smart Approach to Complex Manufacturing

### Hardware & Software = Efficiency and Reliability

We are not just developers or designers. Our greatest advantage is that we manage the entire process of development, production, and assembly in-house. We start with high-quality mechanical design and precise processing. We connect designers with control system developers. As a result, the final functional automation is tailored to your needs, and the software optimally controls the entire production line.

### Flexibility in Production Without Unnecessary Losses

Do you operate lean manufacturing and need maximum flexibility in machine utilization? We are happy to provide a comprehensive solution that allows you to easily exclude a machine from automation through a few hardware adjustments and start using it in manual mode. But what about the rest of the automation line? In the IPM system, the machine is blocked, and the entire system begins to plan order processing on available machines according to predefined priorities.

### Tailored Customization – Solved

Every customer is unique and has specific requirements. The IPM system utilizes as many pre-prepared modules as possible, but we can program exactly what you need. Do you have a special priority system? Do you need specific order status reports? We can adapt and customize the IPM system to meet your expectations and ensure your satisfaction.

### Real-Time Production Management

The IPM system is designed to combine production management according to your requirements. Do you need to quickly respond to incoming orders and adjust the production queue during the day? No problem. We will prepare a tailored optimization based on your factory's needs. In unattended mode at night, production can continue for parts that have sufficient material and do not require operator process control. The IPM system is highly intuitive—you can start or stop the entire production process with a single button.

### IPM System Features

- User management
- Web and mobile application
- ERP connectivity
- Production statistics
